Hand Rail Measuring Instructions

- Be sure to provide all the information required in the legend at the bottom of each template before returning it to Door Guard.
- Circle the cab location for each hand rail as positioned by HH, KK and NN.
- The measurements from the end of each hand rail to the adjacent wall (e.g. GG, HH, II etc.) is to help us determine the design & length of the cab wall liners
- For walls with hand rails, the wall liners will be placed in front of the handrails. “Spacers” will be provided for the upper and lower positions of the walls to provide Wall Liner stability. The measurement FF from the wall to the outer surface of the hand rail is critical to fabricating the exact thickness of the “Spacers”.

We strongly urge the person providing the measurements to Door Guard to call and confer with our staff prior to taking any measurements. It is also helpful for the person taking the measurements to see a copy of our product brochure to better understand the purpose of the measurements he or she is providing. Photos of our products can be seen on our website www.doorguardllc.com > on the “Products” page. Please call us at 724.695.8936 or e-mail us at doorguard@worldnet.att.net if you have any questions.
